The proteins are useful for treating a disease or disorder that may be modulated by therapoutic protein X. The albumin extends the shelf-life of protein X, and may increase its biological in vitro/in vivo activity. The protein is useful for treating and diagnosing disorders such as cancer, reproductive disorders, disease, observe colitis), inmune disorders (e.g. acquired immunodeficiency syndrome, AIDS), endocrine disorders (e.g. alabetes), haematopoletic disorders, neural disorders (e.g. Alzheimer's, Parkinson's, Creurzfeld-(arob disease, encephalumylitis, meninglitis, subliciphicula), and connective disorders (e.g. osteoporosis, arthritis). and determining the amount of bound protein in the sample. The polyreptides may be used as antipeles in the production of antibodies specific for P acres proteins. These antibodies can be used to
                                             pustulosis, hypertosis and osteomyelitis), uveitis and endophthalmitis. P. acres is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acre vulyaris. A method for detecting the presence or absence of P. acres in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention
                                                                                                                                                   Sequences AAHR4105-AAH68017 represent Propionibacterium aches immunoquento polypeptides. The proteins and their associated CNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by P. aches. The disorders include SAPHO syndrome (synovitis, ache,
                                                                                                                                                                                                                                                                          Propionibacterium acnes polypeptides and nucleic acids useful for vaccinating against and diagnosing infections, especially useful treating acne vulgaris -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        71-AFF 2000, 2000US-199047P

AAU14602-AAJ14794 represent hovel bone marrow polypeptides of the invention. The proteins and corresponding moding sequences may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate bone marrow polypeptide expression. For example, to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of the polypeptides by expressing inactive proteins or to supplement the patient's own professing inactive proteins or to supplement the patient's own professing inactive proteins or to supplement the patient's own professing inactive proteins, by inserting the nucleic acids may be used to produce the polypeptides, by inserting the nucleic acids into a host cell and culturing the cell to express the protein. The nucleic acids into a host cell and culturing the cell to express the protein. The nucleic acids in the acid is DNA probes in diagnostic assays to determ and quantitae the prosence of similar nucleic acid sequences in samples, and therefore which patients
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         inwriegalate expression in a mixtry of a larger 1/2 eptilos and therefore treat in since infertions like anticodies may also be used as displaced a space. It is not to be resident as a part of the principal enzyme liked immunosorbert as any ELISA.

Note The request of the first this proof libration from part of the principal epsilon. The request of the principal epsilon, but was obtained in electronic format directly from WIPO repositionic format directly from WIPO.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       at ftp.wipo.int/pub/published_put_sequences.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            PATHWAY: Polyunsaturated fatty acid biosynthesis.
SUBCELULIAR LOCALION: CHLOROPLAST, MEMBRANE-BOUND (PRORAPLE)
DOMAIN: THE HISTIDINE BOX FOMALIS MAY CONTAIN THE ACTIVE SIT
AND/ OR BE INVOLVED IN METAL ION BINDING.
SIMILARITY: RELONGS TO THE FATTY ACID DESATURASE FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            IT PHYSIO 105-636-641(1994)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Peptides which bind to the DNA binding domain of transcription factor E2F and inhibit cell cycle progression may be useful as research agents to investigate the interaction between E2F and DP-1, or the activation of transcription by E2F-1/EP-1 heterodimers. They may also be used for inducing apoptosis and/or cell cycle arrest in a cell, particularly for treatment of cancer or other proliferative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                DNA binding, transcription factor, EDF, EDF-1, cell cycle, DP-1; activation; transcription; apoptocis; proliferative disorder;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Peptides binding to the DNA binding domain of transcription factor and inhibiting cell cycle progression, useful for the treatment of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Synthetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Peptide which binds to transcription factor E2E-1 DNA binding domain

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; brain expressed exon; gene expression analysis; probe;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      05 - NOV - 2001
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Note: The sequence data for this patent did not form part of the grinted specification, but was obtained in electronic final line
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a peride encoded by a single exon
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from huma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  WPI; 2001-483447/52

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention provides a number of single even models and probes which are derived from general sequences expressed in the human probes which are derived from general expression in brain cell samples, which may enable the digness and improved treatment of nervous system diseases such as Alzheimer's disease, multiple sclerosis, schizophrenia.
                                                                                  The present invention provides a number of single executive and decide probability and derived from journal requestes expressed in the human brown marrow. They may be pasted for respect exercisin in blue marrow samples, which may emble the improved diagnosis and treatment of announces such as lymphoma, lenkapmia and myeloma. The present sequence is a protein encoded by one of the probes of the invention

The proteins apriled in the production of antibodies against bone marrow proteins and in assays to identify modulators of their expression and accivity. The anti-hone marrow protein antibodies and antagonist may also be used.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       or deletions in a patient's genome that affect the activity of the polypeptides by expressing inactive proteins or to supplement the polypeptide. Additionally, the nucleic acids may be used to produce the polypeptide. Additionally, the nucleic acids may be used to produce the polypeptides, by inserting the nucleic acids into a host cell and culturing the cell to express the protein. The nucleic acids into a cid and its complementary seguences may also be used as PNA probes in a diagraph of the complementary seguences may also be used as PNA probes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AAU14602-AAU14794 represent novel bone marrow polypeptides of the invention. The proteins and corresponding coding sequences may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate bone marrow polypeptide expression. For example, to treat disorders associated with decreased expression by recrifying mutations
                                                                                                                                                                                                                                                                                                                                                                          as diagnostic agents for detecting the presence of the protein in samples (e.g. by enzyme linked immunosorbant assay (FLISA)). The proteins may be used to regulate haematopoiesis activity, and consequently in the treatment of myeloid or lymph cell disorders; in tissue regeneration, of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              03-FEB-2000; 2000US-0496914.

                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to albumin fusion proteins comprising a therapeutic protein X and human albumin (HA, also known as human serum albumin, HSA). The proteins are useful for treating a disease or disorder that may be modulated by therapeutic protein X. The albumin extends the shelf life of protein X, and may increase its biological in vitro/in vivo activity. The protein is useful for treating and diagnosing disorders such as cancer, reproductive disorders, dispective disorders (e.g. grown's disease, ulcerative colitis), immune disorders (e.g. armired immunedafiliency syndrome, AITS), endorine disorders (e.g. diabetes), haematopoletic disorders, neural disorders (e.g. diabetes), haematopoletic disorders, neural disorders (c.g. Alzheimer's, Parkingon's, Creutzfeldt Jacob disease, encephalomyplitis, meningitis, schizephrenia), and connective disorders (e.g. esterporesis, arthritis).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           digestive disorder; immune disorder; endocrine disorder; hasmatopoietic disorder; neural disorder; connective disorders; antiinflammatory; antiulcer;

pustulosis, hypertosis and estromyciltis) uveitis and endophthalmitis. P acres is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acre vulgaris. A method for detecting the presence or absence of P, acres in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies specific for P, acres proteins. These antibodies can be used to

The antibodies may also be disjunctify appress to determining F. acree presents. For example, by enzyme linked immunes when array (FETSA) Note: The expression of the prints of the prints associated for this part of the prints associated for account of the prints of appreciate that was obtained in electronic format directly from WHFO appreciation that was obtained in electronic format directly from WHFO appreciations.
ANTIAGO ANTIAGO represent novel becoming colling sequences may be used in the prevention. Alagonais and corresponding colling sequences may be used in the prevention, diagonais and therefore diseases associated with inappropriate beneficiated with dorroased expression. For example, to treat discrete secritated with dorroased expression by restifying mutations or deletions in a parison of gonome that affect the outlity of the polymerists by expressing inactive gonome that affect the outlity of the polymerists by expressing inactive gonome. And thought the nucleic acids may be used to professing inactive gonome. And thought the nucleic acids may be used to profess the polymerists, by inserting the nucleic acids into a host of its profess the polymerists, by inserting the nucleic acids into a diagnostic assays to detect and quantitate the presence of similar nucleic acid assays to detect and quantitate the presence of similar nucleic acid segmences in samples, and therefore which patients
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Bone marrow; diagnostic; therapeutic; gene therapy; antigenic; baena opolesis; myeloid; lymph cell disorder; tissue regenerat would healing; nutritional supplement; inmune disorder;

                                          n = 2-5.
These peptides may be immobilised on a carrier in taborbing agent which may be used in the treatment to anti-DNA antibudies unl/in immore timpos.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   by the claimed generic formula:

H X (A B)n T Z

A = Trp, Phe or a peptide fragment consisting of 2 residues;

B = Trp, Phe, Asn or Glu;

X and Y - a bond or Asp Clu, Arg, Lyc, Hic or a poptide fragment consisting of 2-10 residues, provided that at least one X or Y are present;

Z = CH or NH2; and
                                                                                                                                                                                                                                                                       A poptide and an admirthing agent graph by carrier useful for treatment of diseases

                                                                                                                                                                                                                                                                          Peptides which bind to the DNA binding domain of transcription factor B2F and inhibit cell cycle progression may be useful as rewearch syents to investigate the interaction between B2F and DP-1, or the activation of transcription by B2F 1.DP 1 heterodimors. They may alto be used for indusing applicable and/or cell typle present in a cell, particularly for they mean of chance or other proliferative distinctions can be positive and restorces.
Peptide which binds to transcription factor E2F 1 DNA binding domain

The postide is useful for treating a cell that contains and expresses a protein having an expended golygluramine region (e.g. buntingtin; atrophin 1. ataxin 1. 2. 6 or 7, or androgen receptor protein), or treating a neurodegenerative disease characterised by the presence of expanded polygluramine repeats, e.g. Huntington's disease, dentatorubral pailidoluysian atrophy (ORPLA), spinobulbar muscular atrophy, and spinocorobellar itrail types 1, 2, 3, 6 and 7
                                                                                                                                                                                              Antigen-binding, tumour, diagnosis, stress protein-peptide complex, SPPC, immunogenically cross-reactive, cancer; immunogenic cancer cell; cytostatio; varnino, timour specific immunogenic response inducer, astrocytoma, fibrish: "man, myvosarodma, lipusarodma, cligodendroglioma, ependymoma, medulichlastoma, primitive neural ectodermal tumour.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           OC protein-peptide complexes (SPPC) associated with tumours that is conspectfically immunogenically cross-reactive with cell surface associated SPPCs specifically immunogenically cross-reactive with cell surface associated CC SPPCs specific to target cancer (TO. Also described is an isolated CC antigen binding fragment of an antibody that binds specifically to spons or a population of different spPCs consisting of immunogenic cancer cell CC curface associated SPPC of TO. (I) has sytuative activity and the consequence consequence in a consequence in a consequence of inducer. (I) is useful for treating 71 types of cancers or theorems in a consideration as astronymous, mediculobiasters, mysosarcoma, biposarcoma, collegedentroglioma, spendymoma, mediculobiasters, and primitive neural CC encornes. (I) is useful for diagnostic and palliative use, for detecting continuous continuous in an individual. AAM43/07 to AAM47109 represent populides which are used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Matches

comprise peptide chains if approximately 6 to 40 amino acids in
that bind to granulocyte colony stimulating factor receptor -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    factor EDF and inhibit cell cycle progression may be useful as research agents to investigate the interestion between EDF and EP), it is a view to the form of principle progression. They old be used for inhibit approach on the cycle arrest in a cell particularly for inequality in the particularly for inequality in the consist.

                            A method has been developed for identifying a ligand which mediates the CC biological activity of a target protein (T) by inhibiting the binding of (T) to a binding partner. The method comprises: (a) screening a first CC combinatorial library comprising first member ligands for binding to the CC screening a second library comprising first member ligands for binding to the CC screening a second library comprising second member ligands for the CC ability to inhibit the binding of one or more of the TBLs to the target CC protein, and so obtaining one or more inhibitory ligands; and (c) CC determining which of the inhibitory ligands can mediate a biological CC activity of the target protein. The present sequence represents a CC potential binding peptide for Haemophilus influence tyrocine tRNA CC synthetase from an example of the present influence tyrocine tRNA CC synthetase from an example of the present influence tyrocine tRNA CC synthetase from an example of the present influence tyrocine tRNA CC at target protein. It can be used to identify the biological activity of CC a target protein whose biological function is not known and perhaps CC at the determined directly. The method can also be used to identify the present introduced to identify of CC a target protein whose biological function is not known and perhaps CC mew inhibitory ligands of specific target proteins. The method provides thigh throughput screens which are essentially identical for similar and CC biochemically diverse targets.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               RESULT 15
